FINAL PROJECT: Please send to dhunterstat.psu.edu the week of December 15.

Prepare a statistical report that could be edited down to comprise part of a journal publication in your field. As you do this, you should keep in mind the guidelines for assignment #2, which are reproduced here in modified form:

1. **What is the scientific question you are trying to answer?** You should write for an audience that is scientifically literate in statistics and forensic science but perhaps not in the particular subfield in which you are working. You might not write in this way if you plan to submit your work to a specific publication, but if you do it here, this will help me to read and understand your work. In particular, please define any jargon or abbreviations that you use.

2. **What form do your data take?** Describe the variables that you measure along with details about the scale on which they are measured, such as whether they are quantitative or categorical. It will help if you include some details about the data collection process as well.

3. **What statistical methods have you brought to bear on the questions you have described, and what did you find?** Describe your statistical results both quantitatively, using output from statistical software as appropriate, and qualitatively, using descriptive language from your scientific field. Use graphical displays whenever doing so makes it easier for your audience to understand what you have found.
